Node	Description	Examples ref. sheet
SU 9	white rectangle = US (or US) stands for Stratigraphic Unit (or Context). A specialization is the -SU or negative stratigraphic unit that describes a gap on a SU.	В1
SU 10	white ellipse = US series. A series of US objects like a group of <i>pilae</i> from a thermal bath can be considered as a whole. This seriation node acts like a proxy for the entire group.	В3
•	black rhombus = continuity node describes the end of life of a US/USV.	
USV 100	black parallelogram = USV/s or structural Virtual Stratigraphic Unit is a reconstruction hypothesis made starting from an <i>in situ</i> fragmented SU. It acts as a restoration of a -SU so that its presence is physically "proved".	В1
USV 101	black hexagon = USV/n or non-structural Virtual Stratigraphic Unit (reconstruction hypothesis made starting from "sources" like comparisons, general rules etc). It is not connected to a -SU and, as a result, it is not physically "proved".	В2
SF 1	white octagon = Special Find. It refers to a not <i>in situ</i> element (fragmented or intact) that needs to be repositioned. It is a real object so that you know several properties (color, material, etc) <i>except</i> the original position.	В5
USV 102	black octagon = Virtual Special Find . It represents an hypothetical reconstruction of a fragmented Special Find (<i>not in situ</i> element).	В5
USV 103	black ellipse = USV series. A series of USVn objects like a colonnade or a sequence of acroterion can be considered as a whole. This seriation node acts like a proxy for the entire group.	В3
D.01.1	extractor icon = extractor node capable of extracting specific information from a source and passing it to a property.	C1
\$01	combiner icon = combiner node capable of combining information provided by two extraction nodes and passing the resulting value to a property.	C2
material	<pre>grey rounded square = property. A property node validates a USV it is connected to. Examples of properties are "material", "dimension", "placement", etc</pre>	C1
D.01	document icon = source . A source node feeds a property of a USV it is connected to (throught an extractor node). A source can be an image, a text, a reference, a 3D model etc More documents need a combiner node.	C1
